

OVERVIEW

Dental Implantology is probably the most advanced as well as the fastest growing specialty in Dentistry. However, in regular practice more often than not we find that patients do not have sufficient bone to place conventional implants. The only option before was to do extensive grafting and sinus lifting procedures which will take many months and is very expensive. Loading of the implants would only be done after a period of three to six months which is very inconvenient to the patient as well as the dentist.

With the advent of Basal Implants by Prof. Dr. Stefan Ihde the need for such bone augmentation is almost nil and the system demands fixation of teeth within 72 hours. Moreover this procedure is done under "keyhole procedures" minimizing trauma to hard and soft tissues. Cases which had been rejected before due to non-availability of bone ("No Bone" cases) turn treatable with excellent success rates with the help of Strategic Immediate Basal Implants.

In this day and age of consumerism, where time is money, our patients are turning more and more demanding. Strategic Implantology will empower you to give your patients what they want: Fixed & Functional Teeth in just three days.
